

I first thought about what an array was so I searched devdocs. What is an array? What I found is that an array is a list but what is a list? A list is a collection of things. A collection is a bunch of things organized in some manner or it could be nothing. They can be organized in some logical or non-logical fashion. They can be numbers, characters, booleans, and collections. I made two different types of arrays, a short array and a long array. I used `.pop` so I can get just the last number in the list which in this case was 26 for a and 5 for b. After it gets those numbers it prints them.
